Personal Statement

AI Software Engineer who led **0-to-1** development of a multi-tenant SaaS platform and production AI agent with custom MCP tooling and CI-gated LLM evaluations - shipped MVP **2 weeks ahead of schedule** and scaled the platform from **200 → 1,000+ users**.

Experience

ServiceMob — **October 2025 – Present**

AI Software Engineer Intern → AI Software Engineer — *California, Irvine*

- Shipped a production **AI chatbot** with 2 custom MCPs (ClickHouse analytics, call-transcript retrieval) under tenant isolation; cut time-to-first-token **20s → 1s** and tuned prompt caching to 60%+ cache-read at ∼1k turns/day.
- Built a **CI-gated LLM eval harness** (hybrid deterministic + LLM-as-judge, blocks deploys on >10% regression) that drove production model selection - Sonnet/Haiku matched Opus accuracy and **cut average inference cost by 93%**.
- Architected a **dynamic SQL builder pipeline** (3 packages, 67 internal consumers) with a node-based DSL, dependency-graph traversal, and CTE hoisting; one registry powers **62 metrics across 173 analytics endpoints**.
- Built an **ensemble forecasting engine** across 5 channels (contact volume, AHT, staffing) with MAPE / WAPE backtests and R^2-weighted champion selection; shipped LLM-powered coaching reports for **1,000+ users**.

RE:JOIN — **August 2023 – April 2024**

Software Engineer - Mobile App Developer — *Remote*

- Revamped the mobile app given specifications set via Figma and solved the top 3 reported bugs for multi device design.
- Enhanced screens and widgets with seamless integration using dependency injections improving **reusability by 30%**.
- Engineered real-time chat room feature, supporting over 20 active users and increased engagement by 40%.

Projects

Neutron and Muon Source - Dissertation (82%) | *Python with Jupyter Notebook* — **September 2023 - April 2024**

- Formulated and tuned five ML algorithms from **scikit-learn** to predict ion-source failures in a **particle accelerator**.
- Achieved 90% in failure prediction accuracy. Presented the findings to **UKRI** and influenced further investment.

NLU - LLM Evidence Detection | *Python with Jupyter Notebook* — **March 2024 - April 2024**

- Classified 5,927 unseen claim-evidence pairs using Logistic Regression and CNN with an Attention Layer.
- Carefully preprocessed tokens for both LLMs to outperform the given baselines by 5-8% in accuracy and precision.

Education

The University of Manchester, United Kingdom — **September 2021 – July 2024**

Computer Science: 2:1 — *Bachelor of Science (with Honors)*

Technical Skills

Languages: Python, Java, C#, TypeScript, Svelte, JavaScript, Node.js, SQL, HTML/CSS, Dart, Flutter

AI & Data: LangChain, LLM, RAG, Anthropic Claude, MCP, LLM Evals, scikit-learn, TensorFlow, ClickHouse, PostgreSQL, Prisma

Developer Tools: AWS (CDK, ECS, Cognito, Bedrock, Amplify, CloudWatch), Docker, CI/CD, Git, Cursor, Jupyter, Figma

Achievements and Awards

Build YC's Next Unicorn: 2nd of 1,100+ participants; built 0-to-1 with a live demo to a Y Combinator panel of judges.

GDSC AI/ML Co-Lead: Co-Lead for the AI/ML Google Developer Student Club. Mentored and coached 35 students.
