Personal Statement

AI Software Engineer and lead of a 2-engineer team. Drove 0-to-1 development of a multi-tenant **RBAC** SaaS platform and production AI agent with custom **MCP servers**, scaling **200** → **1,000+** users. Makes model and architecture decisions from **evaluation and observability** data (CI-gated offline evals blending deterministic heuristics with **LLM-as-judge**, plus production SLO monitoring), cutting inference cost **93%** and time-to-first-token **20x** at matched accuracy.

Experience

ServiceMob

October 2025 – Present

AI Software Engineer

California, Irvine

- Built a **CI-gated LLM eval harness** (hybrid deterministic + LLM-as-judge, blocks deploys on >10% regression) that drove production model selection - Sonnet/Haiku matched Opus accuracy and **cut average inference cost by 93%**.
- Shipped a production **AI agent** with 2 custom MCP servers (ClickHouse, call-transcript retrieval) under tenant isolation; cut time-to-first-token **20s** → **1s** and tuned prompt caching to 60%+ cache-read at ~1k turns/day.
- Built a production **RAG pipeline** (Vertex AI embeddings, **Qdrant**) that grounds the AI coaching agent in real resolved cases, shipping cited reports to **1,000+ users** and cutting Athena scan cost **87x** via batched ingest.
- Architected a **dynamic SQL builder pipeline** (3 packages, 67 internal consumers) with a node-based DSL, dependency-graph traversal, and CTE hoisting; one registry powers **62 metrics across 173 analytics endpoints**.

RE:JOIN

August 2023 – April 2024

Software Engineer - Full Stack

Remote

- Revamped the mobile app given specifications set via Figma and solved the top 3 reported bugs for multi device design.
- Enhanced screens and widgets with seamless integration using dependency injections improving **reusability by 30%**.
- Engineered real-time chat room feature, supporting over 20 active users and increased engagement by 40%.

Projects

TrueConsent - Build YC's Next Unicorn (2nd of 1,100+) | Full-stack, Next.js

April 2026

- Built a full-stack AI product that turns any insurance-denial document into a complete **grounded appeal** in <60s.
- Boxed the LLM behind a deterministic rule engine and placed **2nd of 1,100+** at a Y Combinator Hackathon.

Machine Learning for Particle Accelerator (First Class) | Python, scikit-learn

September 2023 - April 2024

- Formulated and tuned **five ML algorithms** (logistic regression, AdaBoost, XGBoost) on **time-series** sensor data.
- Achieved **90% accuracy** in failure prediction; presented findings to **UKRI** and influenced further investment.

Education

The University of Manchester, United Kingdom

September 2021 – July 2024

Bachelor of Science in Computer Science (with Honours)

Technical Skills

Languages: Python, Java, C#, TypeScript, Svelte, JavaScript, Node.js, SQL, HTML/CSS

AI & Data: LangChain, MCP, RAG, LLM Evals, AI Cost Optimization, scikit-learn, TensorFlow, Prisma, ClickHouse

Developer Tools: AWS (Athena, ECS, Cognito, Bedrock, Amplify), Docker, CI/CD, Git, Jupyter, Figma, Linear

Achievements and Awards

Build YC's Next Unicorn: 2nd of 1,100+ participants; built 0-to-1 with a live demo to a Y Combinator panel of judges.

GDSC AI/ML Co-Lead: Co-Lead for the AI/ML Google Developer Student Club. Mentored and coached 35 students.
